

RKE Configuration Options

Unit 3.2.1

Lions and Tigers and Options, Oh My!

When deploying an RKE cluster, there are a myriad of options available to you, from Kubernetes version to the NodePort range, to whether or not you want the Nginx ingress controller deployed in the cluster.

These options can inherit from an RKE template, which you'll learn about in the next module, and that may control whether they can be edited and what sort of editing is allowed.

More information is available in [the documentation](#) about these options, and for today, the defaults will serve you just fine.
