

Troubleshooting: Rancher's API Server

Unit 3.3.2

Rancher's API Server

When troubleshooting Rancher itself, the Rancher API server is the first place to look.

If you're running an HA Rancher cluster, there will be three pods running the API server, so you'll need to check each of them for logs that might show signs of a problem.

You can view the logs of the pods running within the cluster by looking at pods in the cattle-system namespace with the label app=rancher.
