

Cloud Providers

Unit 3.2.4

Cloud Provider Configuration

Infrastructure and Custom clusters allow you to set a cloud provider. This makes changes to how the cluster operates. For example, if you choose the Amazon cloud provider, deployment of a LoadBalancer Service into the cluster will create an Amazon ELB.

Cloud providers require additional configuration of the cluster nodes to operate correctly. In some cases, if you choose a cloud provider without first completing that configuration, the cluster won't deploy at all.

See [our documentation](#) for more information on cloud providers and the additional configuration required by the providers.
