Project Alerts

Unit 4.5.3

Project Alerts

We set up notifiers for the cluster in an earlier unit, and we showed how to configure alert groups and alerts for cluster-level issues like etcd leader changes.

Project alerts use the same notifiers but send alerts for workloads running within the project.

Options are available for specific Pods, Workloads, or selectors, and if project-level monitoring is active, you can use arbitrary PromQL expressions to define the criteria.

Alert rules can be set to an urgency of critical, warning, or info, and they can either inherit the wait and interval times from the alert group or override them.
